SICK
Sensor Intelligence.

1 Scope

These operating instructions are only applicable to the UE43-2MF safety relays with the following entry on the type label in the field *Operating Instructions: 8009660*.

You will find the device's date of manufacture on the type label in the field *Date Code* in the format *yywwxxx* (*yy* = year, *ww* = calendar week, *xxx* = serial number).

These operating instructions are original operating instructions.

2 On safety

This chapter deals with your own safety and the safety of the equipment operators.

➤ Please read this chapter carefully before working with the UE43-2MF or with the machine protected by the UE43-2MF.

2.1 Qualified safety personnel

The UE43-2MF safety relay must only be installed, commissioned and serviced by qualified safety personnel.

Qualified safety personnel are defined as persons who ...

- have undergone the appropriate technical training and
- have been instructed by the responsible machine operator in the operation of the machine and the current valid safety guidelines and
- have access to the operating instructions of the UE43-2MF safety relay and have read and familiarised themselves with them.

2.2 Applications of the device

The UE43-2MF safety relay can be used:

- in accordance with EN ISO 13849 up to PL e and category 4
- in accordance with EN 62061 to SILCL3
- in accordance with IEC 61508 up to SIL3

The actual performance level or SIL claim limit achieved depends on the external circuit, the design of the wiring, the selection of the control switch and its placement on the machine.

The UE43-2MF safety relay has been evaluated to UL 508.

The related actuators on the machine or system can be safely shut down using the safety relay's output signal switching contacts.

The UE43-2MF safety relay is used only for safety sensors with volt-free output contacts or safety switches, e.g.:

- emergency stop pushbuttons (EN ISO 13850): single- or dual-channel, e.g. SICK ES21
- safety interlocks (EN 1088): single- or dual-channel, e.g. safety doors
- safety circuits in accordance with EN 60 204-1, e.g. for moving covers

2.3 Correct use

The UE43-2MF safety relay must be used only as defined in section 2.2 "Applications of the device". It must be used only by qualified safety personnel and only on the machine where it has been installed and initialised by qualified safety personnel in accordance with the operating instructions. If the device is used for any other purposes or modified in any way – also during mounting and assembly – any warranty claim against SICK AG shall become void.

2.4 General safety notes and protective measures

⚠ Pay attention to the safety notes and protective measures!

Please observe the following items in order to ensure the correct use of the UE43-2MF safety relays.

- During the mounting, installation and usage of the safety relay, observe the standards and directives applicable in your country.
- The national/international rules and regulations apply to the installation, commissioning, use and periodic technical inspection of the safety relay, in particular:
 - Machinery Directive
 - Work Equipment Directive
 - EMC directive
 - the work safety regulations and safety rules
- Manufacturers and operators of the machine on which a safety relay is used are responsible for obtaining and observing all applicable safety regulations and rules.
- The tests must be carried out by qualified safety personnel or specially qualified and authorised personnel and must be recorded and documented to ensure that the tests can be reproduced and retraced at any time by third parties.
- The operating instructions must be made available to the operator of the machine where the UE43-2MF is used.
- The machine operator is to be instructed in the use of the device by qualified safety personnel and must be instructed to read the operating instructions.

3 Product description

3.1 Structure and operating principle of the device

The inputs on the UE43-2MF safety relay are prepared for the connection of the control switches or safety sensors listed in section 2.2 "Applications of the device".

The two enable current paths are designed as safe outputs. The signalling current path is a non-safety related output.

3.2 Device functions

The actuation of the sensor results in the opening of the three enable current paths and the closing of the signalling current path. Manual or automatic reset as well as external device monitoring are to be implemented using external wiring as required (see 5.3 "Reset" and 5.4 "External device monitoring").

Synchronization monitoring: Upon activating the input circuits, synchronization is monitored. Only if the input circuit 2 closes by no later than 0.5 sec after input circuit 1, will the output circuits close too. If input circuit 2 closes before input circuit 1, then no synchronization monitoring occurs, and the output circuit will close (the signal circuit is thus open).

Cross circuit detection: A cross-circuit is detected on the dual-channel connection of the input circuits, if these are connected to different polarities.

⚠ In order to attain SIL3/PL e, connect the external device monitoring!

In order to reach SIL3/PL e, an external diagnosis with DC $\geq 99\%$ must be applied (i.e. the external device monitoring must be connected).

Please also read the notes in chapter 12 "Application examples".

Status indicators

Display	Meaning
SUPPLY ● Green	Supply voltage active
K1 ● Green	Channel 1 switched
K2 ● Green	Channel 2 switched

4 Mounting

⚠ Mounting only with enclosure rating IP54 or better!

The safety relay is only allowed to be mounted in the control cabinet. The control cabinet must at least comply with enclosure rating IP54.

➤ Mounting in accordance with EN 50274.

➤ The modules are located in a 22.5 mm wide modular system for 35 mm mounting rails as per EN 60 715.

5 Electrical installation

Note:

All external switching elements and their wiring must withstand an ampacity, maximal short-circuit load of $I_{max} = 1000$ A (according to EN 60 947-5-1).

⚠ Switch the entire machine/system off line!

- The voltage supply must satisfy the regulations for extra-low voltages with safe isolation (SELV, PELV) for overvoltage category II as per EN 60 664 and EN 50 178.

Note:

The basic insulation of the components connected to the module must match the highest voltage connected to the module. All circuits (and if necessary other EDM) must then also be designed for the highest voltage level.

- All connections, wiring and cable runs must comply with the required category as per EN ISO 13 849 and EN 62 061 (e.g. cables laid with protection, individually sheathed cable with screen etc.).
- To protect the contact outputs on the UE43-2MF and to increase the service life, the loads connected must be equipped with, e.g., varistors and RC circuits. Please also note that the selection of the arc suppression can increase the total response time of the safety function. For installation in environments of overvoltage category III, external protection elements must be used.
- The output signal switching devices and the external device monitoring (EDM) must be wired in the control cabinet.
- To prevent the welding of the contacts on the built-in relay, an overcurrent protection device with short-circuit protection (duty class gG) in accordance with the related usage category is to be selected and integrated into the enable current paths (see Fig. 2, fuse F2/F3).

5.1 Pin assignments

Terminal	Description
A1	Voltage supply (+24 V DC)
A2	Voltage supply (0 V DC)
S11/S33	+24 V DC (control voltage)
S21	0 V DC (control voltage)
S12-S35	Automatic reset
S33-S34	Manual Reset
S12	+ Input circuit 1 (K1)
S31	+ Input circuit 2 (K2)
S22	- Input circuit 2 (K2)
13-14	Enable current path 1
23-24	Enable current path 2
31-32	Signalling current path (not safe)

5.2 Operating modes

Single-channel operation

The volt-free switching element on the safety sensor is connected between S11 and S12. Wire jumpers are to be connected between S12 and S31 as well as between S21 and S22. (see Fig. 3).

Dual-channel operation

One volt-free switching element on the safety sensor is to be connected between S33 and S12, the second element between S21 and S22. A wire jumper is to be connected between S31 and S33 (see Fig. 4 and Fig. 5).

5.3 Reset

Manual reset

The reset button (N/O contact) is to be wired to the terminals S33 and S34. The reset button is to be installed outside the hazardous area such that it cannot be pressed from inside the hazardous area. When operating the reset button, the operator must have full visual command of the hazardous area. The reset is monitored. For emergency switching off applications, a manual reset is to be used.

Automatic reset

A wire jumper is to be connected between S12 and S35.

5.4 External device monitoring

The external device monitoring is only effective on reset. The connection of the N/C contacts on the contact elements operated in series with the reset circuit provides this external device monitoring.

6 Commissioning and regular tests

⚠ Commissioning requires a thorough check by qualified safety personnel!

Before you operate a system protected by the safety relay for the first time, make sure that the system is first checked and released by qualified safety personnel.

- Please read the notes in chapter 2 "On safety".
- Observe the relevant laws and national regulations.

⚠ Check the hazardous area!

- Ensure there is nobody in the hazardous area before commissioning.
- Secure the hazardous area against entry.

Regular inspection of the protective devices by qualified safety personnel

➤ Check the system following the inspection intervals specified in the national rules and regulations.

- Each safety application must be checked at an interval specified by you.
- The effectiveness of the protective devices must be checked daily by a specialist or by authorised personnel.

➤ If changes have been made to the machine or the protective device, or the safety relay has been changed or repaired, you must again thoroughly check the entire safety application.

7 In the event of faults or errors

⚠ Cease operation if the cause of the malfunction has not been clearly identified!

- Stop the machine if you cannot clearly identify or allocate the error and if you cannot safely rectify the malfunction.

⚠ Complete function test after rectification of fault!

- After rectifying a fault, perform a complete function test.

8 Disposal

Always dispose of serviceable ness devices in compliance with local/national rules and regulations with respect to waste disposal.

9 Ordering information

Part	Part number (type code)
UE43-2MF for 24 V AC/DC with screw type terminals	6024893 (UE43-2MF2D2)
UE43-2MF for 24 V AC/DC with removable terminals	6024894 (UE43-2MF3D2)

10 Compliance with EU directives

UE43-2MF, Safety relay

SICK AG, Erwin-Sick-Straße 1, D-79183 Waldkirch

You can call up the EU declaration of conformity and the current operating instructions by entering the part number in the search field at www.sick.com (part number: see the type label entry in the "Ident." field).

Direct link to EU declaration of conformity: www.sick.com/9068268

The undersigned, representing the manufacturer, herewith declares that the product is in conformity with the provisions of the following EU directive(s) (including all applicable amendments), and that the standards and/or technical specifications stated in the EU declaration of conformity have been used as a basis for this.

Tension de commande	17,4 V CC	22 V CC	
Courant de commande	40 mA		100 mA
Protection	Résistance CTP		
Temps de réponse au court-circuit interne			3 s
Retard à la mise sous tension après détection d'un court-circuit interne			3 s
Séparation galvanique	Non		
Courant de court-circuit entre S33/S11 et S21			2 A
Circuits d'entrée (S12, S31, S22, S34, S35)			
Courant d'entrée S12 et S31/S22		40 mA	100 mA
Courant d'entrée S34/S35		5 mA	50 mA
Temps de réarmement			
Réarmement manuel (S33/S34)			40 ms
Réarmement automatique (S35)			500 ms
Durée d'actionnement du pousoir de réarmement	50 ms		
Temps de coupe min./retard à la mise sous tension minimal	7 ms		
Résistance du circuit d'entrée			35 Ohm
Surveillance de synchronisation	200 ms		500 ms

¹⁾ Le niveau Performance Level effectivement atteint dépend de l'application. Pour obtenir des informations détaillées sur la configuration physique de la machine/installation, prendre contact avec l'agence SICK la plus proche.

²⁾ Avec CC = 99 % et MTTF_b = 100 a (selon EN ISO 13 849, tab. K1 et formule C.7) et 8760 manœuvres/a.

	Minimum	Typique	Maximum
Circuits de sortie (13/14, 23/24, 31/32)			
Délai de retombée des relais K1/K2			25 ms
Temps minimal de désenclenchement			40 ms
Matériau de contact et état de surface	Ag Sn O ₂ + 2 µ Au		
Contacts de commande (contact NO), organe de sécurité	2		
Contacts d'état (contact NF), organe ordinaire	1		
Type de contact	Guidé		
Charge admissible (voir diagramme)			
Tension de commutation CA	10 V		230 V CA
Tension de commutation CC	10 V		300 V CC
Courant de commutation	10 mA		6 A
Courant total I_{sum}			12 A
Charge admissible par les contacts selon NEMA	B300, R300		
Catégorie d'utilisation (EN 60 947-5-1)	CA-15 Ue 230 V CA, le 4 A (360 cmmt/h) CA-15 Ue 230 V CA, le 3 A (3600 cmmt/h) CC-13 Ue 24 V CC, le 4 A (360 cmmt/h) CC-13 Ue 24 V CC, le 2,5 A (3600 cmmt/h)		
Fusible de protection des contacts de classe gG ou disjoncteur de protection de caractéristique B ou C			6 A
Fréquence de commutation admissible			3600/h
Durée de vie mécanique	10 ⁷ manœuvres		
Pouvoir de coupe CC			
Durée de vie électrique			
Données opérationnelles			
Protection contre le contact (EN 60 664-1, EN 60 947-1)			
Tension impulsionale de mesure U _{imp}		4 kV	
Catégorie de surtension	II		
Tension de mesure	300 V CA		
Tension d'essai U _{eff} 50 Hz	2 kV		
Indice de protection			
Boîtier	IP40 (EN 60 529)		
Bornes	IP20 (EN 60 529)		
Émissions parasites	EN 61 000-6-4		
Immunité aux perturbations	EN 61 000-6-2		
Montage	Rail de montage (EN 60 715)		
Température ambiante de fonctionnement	-25 °C		+55 °C
Température de stockage	-25 °C		+75 °C
Sections du conducteur			
Un conducteur (1x)	0,14 mm ²		2,5 mm ²
Un conducteur (2x, section identique)	0,14 mm ²		0,75 mm ²
Conducteurs toronnés avec manchons (1x)	0,25 mm ²		2,5 mm ²
Conducteurs toronnés avec manchons (2x, section identique)	0,2 mm ²		0,5 mm ²
Couple de serrage admissible		0,5 Nm	0,6 Nm

	Minimum	Typique	Maximum
Pour les applications UL 508 et CSA Section des fils de raccordement			
Couple de serrage	AWG 26-14 (utiliser uniquement des conducteurs multibrins résistants à 60/75 °C) 5-7 lb-in		
Poids	200 g
